

WARMER THAN NORMAL LAKE TEMPERATURES = MORE SNOW?

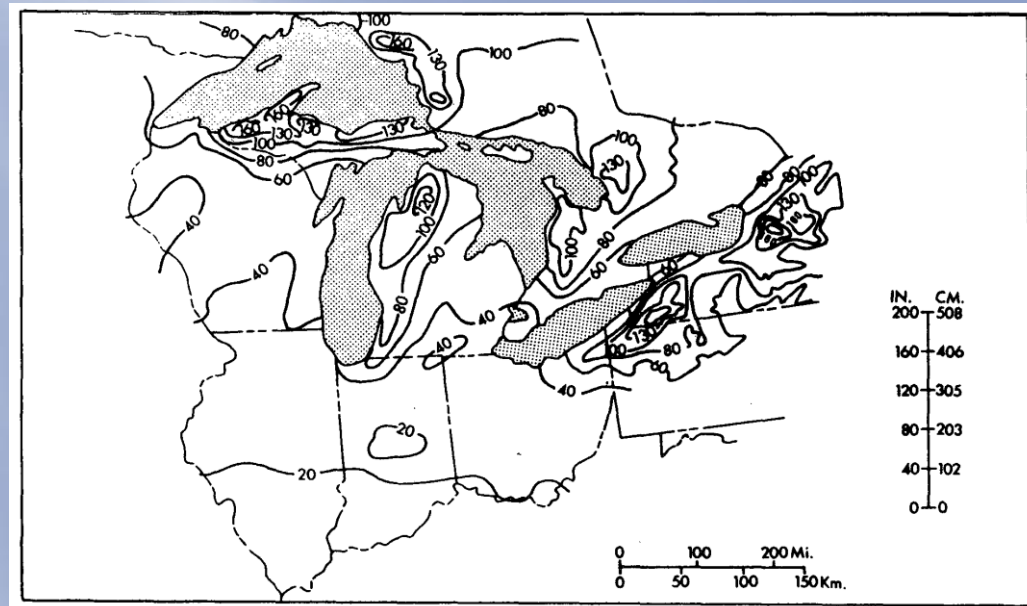

The Premise...

- ❑ Lake Effect snow is caused by cold polar and arctic air masses moving over the warmer waters of the Great Lakes.

Lake Effect Snow Conceptual Model

Mean Annual Snowfall (in)

The Premise...

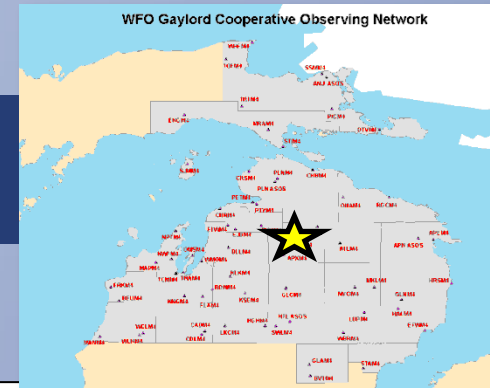

- ▣ Heat and moisture flux from the water to the air is directly related to the air/water temperature difference
- ▣ So, if fall lake temperatures are warmer than normal, shouldn't there be a greater heat/moisture flux and therefore more snow?

Let's Look at Some Data:

▣ The Study:

- Examine snowfall for years when the Great Lakes were warmer than normal
 - ▣ No complete source of long term Great Lakes water temperature data
 - ▣ Do have good long term temperature/snowfall records
 - ▣ Try a few assumptions
 - Warmer summer temperatures \sim Warmer lake waters?
 - Warmer summer nighttime temperatures?
- For this study, examine the top 10 “warmest” summers and then snow the following “fall” (Oct-Dec) and entire winter season (Oct-Apr)

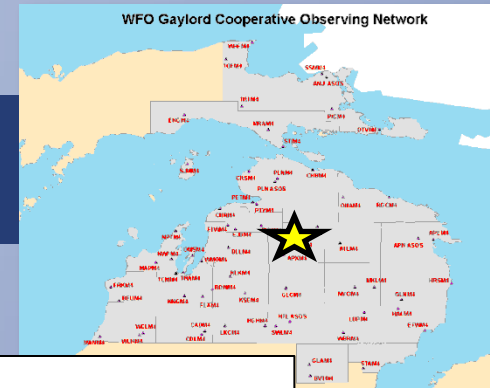

Results – Gaylord, MI

Oct-Dec Snowfall Comparison - GAYM4

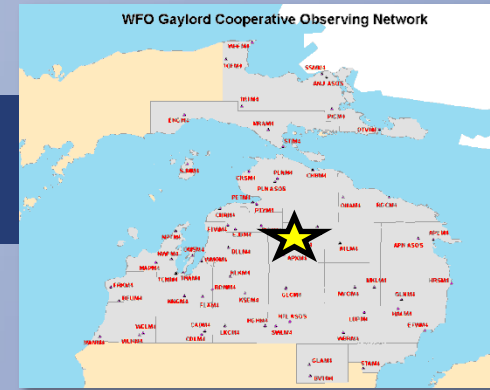

Results – Gaylord, MI

Seasonal Snowfall Comparison - GAYM4

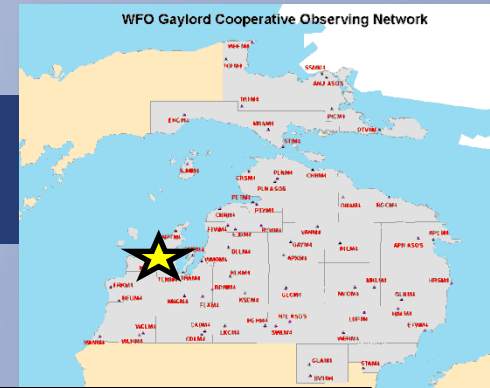

Summary – Gaylord, MI

- Warm Summers → Warmer lakes → More Snow?
- 7 (6 using MinT) out of the 10 warmest summers were followed by more than normal fall snowfall
- 9 (8 using MinT) out of the 10 warmest summers were followed by more than normal seasonal snowfall

Could we be on to something?

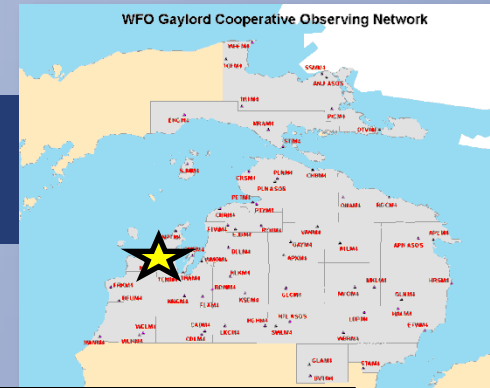

Results – Maple City, MI

Fall Snowfall Comparison - MAPM4

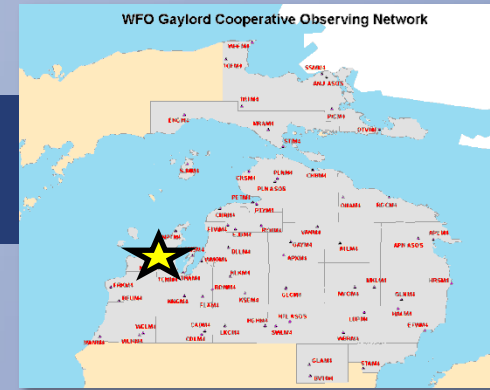

Results – Maple City, MI

Fall Snowfall Comparison - MAPM4

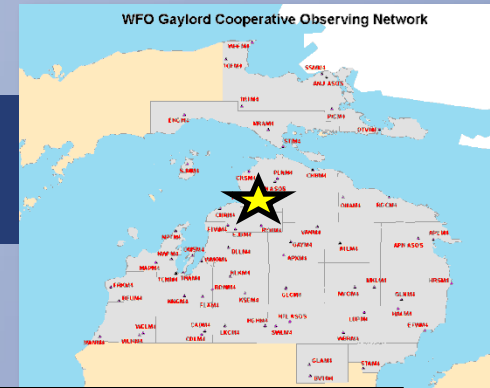

Summary – Maple City, MI

- Uh oh...No Correlation!
- 5 (5 using MinT) out of the 10 warmest summers were followed by more than normal fall snowfall
- 5 (4 using MinT) out of the 10 warmest summers were followed by more than normal seasonal snowfall

Results – Petoskey, MI

Fall Snowfall Comparison - PETM4

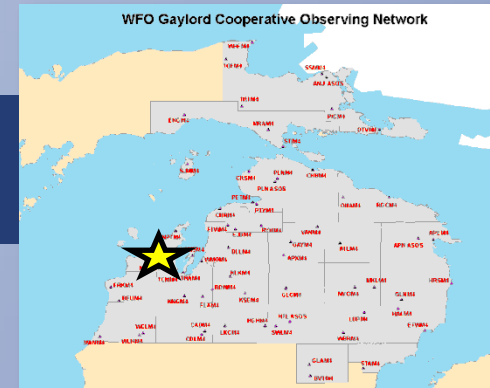

Results – Petoskey, MI

Fall Snowfall Comparison - PETM4

Summary – Petoskey, MI

- Weak/No Correlation
- 4 (4 using MinT) out of the 10 warmest summers were followed by more than normal fall snowfall
- 7 (6 using MinT) out of the 10 warmest summers were followed by more than normal seasonal snowfall

Study Summary

- ▣ Despite evidence of a link at Gaylord, there is little correlation between fall/seasonal snow at Maple City and Petoskey and previous summer lake temperatures
- ▣ What else could be at work?

2006 to 2011 Lake Michigan Temperatures:

2010 Temperature compared to 1992 to 2009 average:

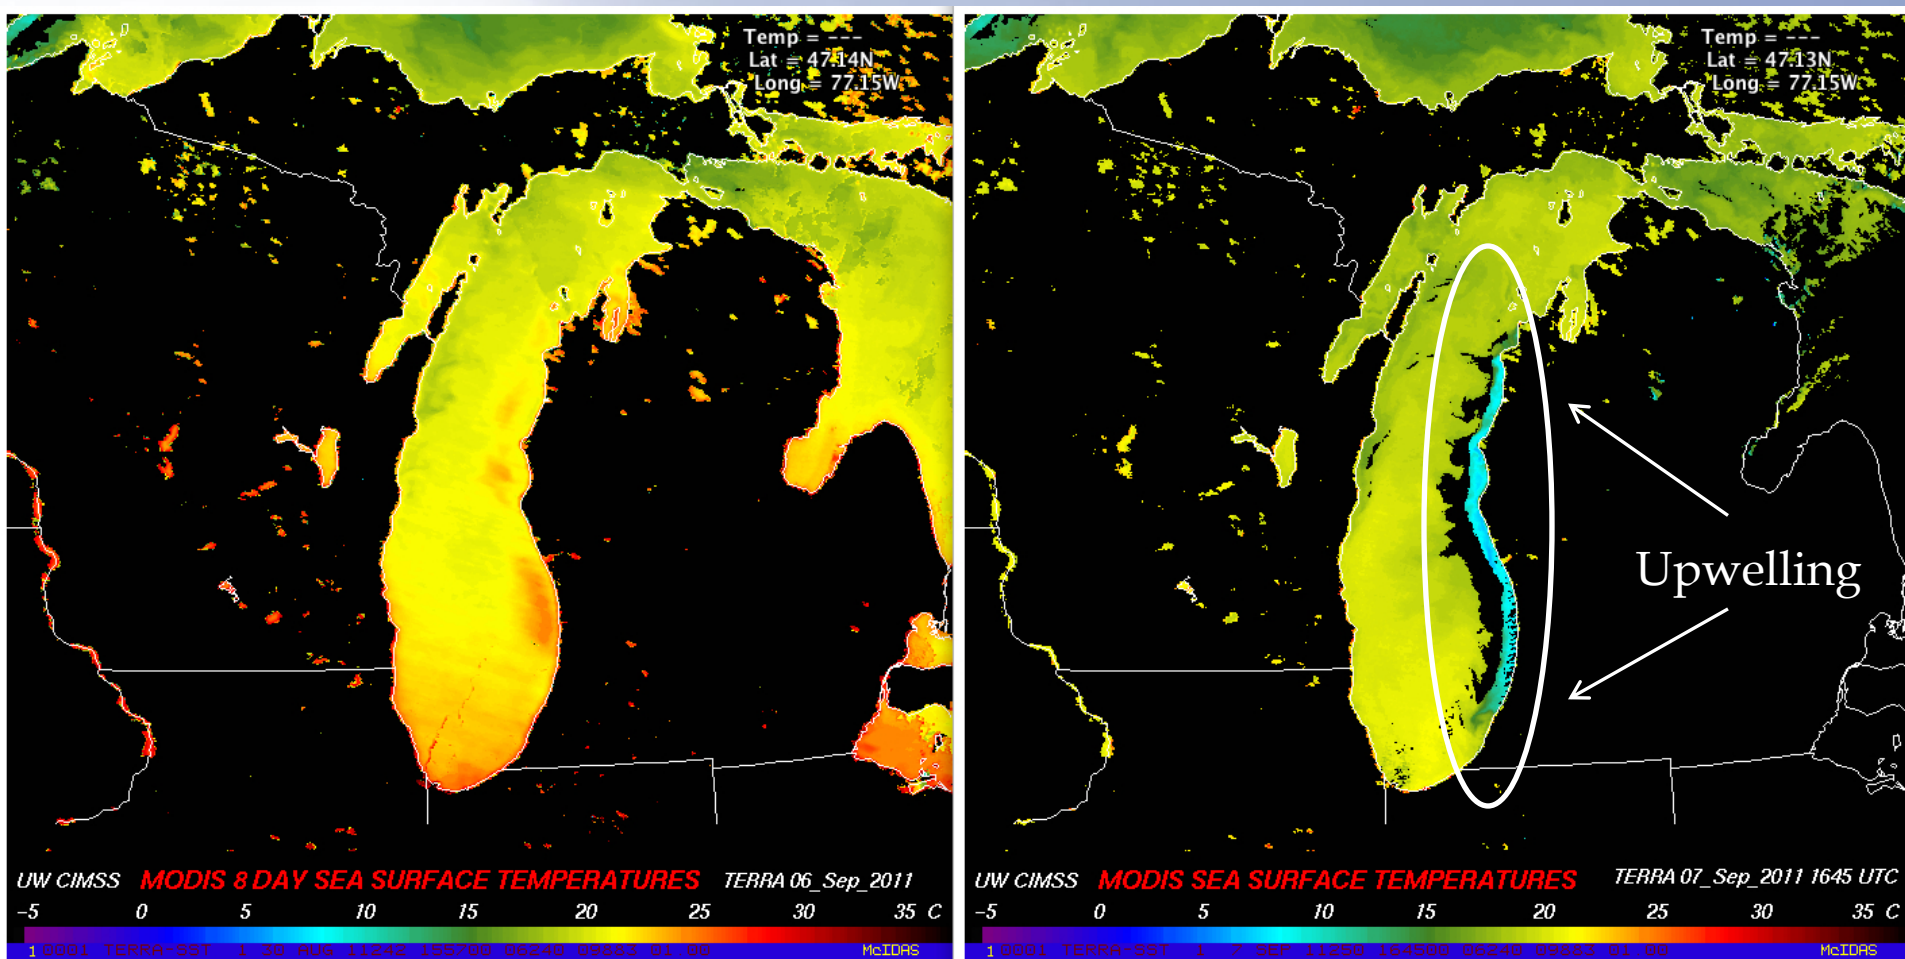

2011 Temperature compared to 1992 to 2009 average:

Lake Michigan Average Great Lakes Surface Environmental Analysis (GLSE)
Surface Water Temperature Compared to Current Year

Lake Michigan temperature change after a day of strong northeast winds :

One location went from 73° F to only 44° F !

Visible and Infrared satellite:

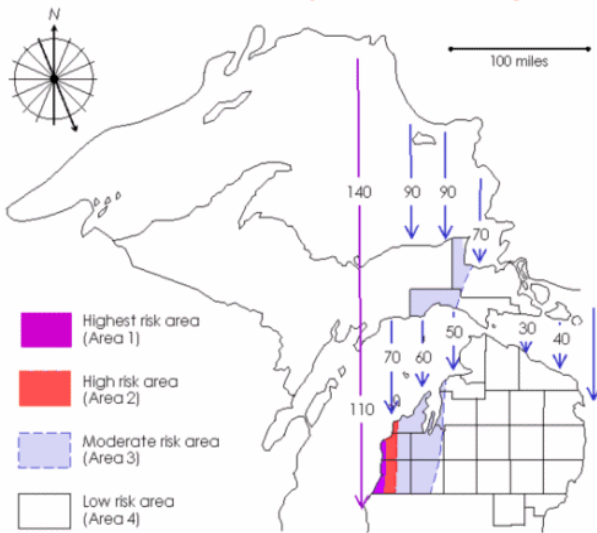

Other Variables

- ▣ Water temperatures can drop rapidly, negating any summertime warmth. What else governs lake effect snow amounts?
 - Wind
 - Air Temperature

Other Impacts on LES - Wind

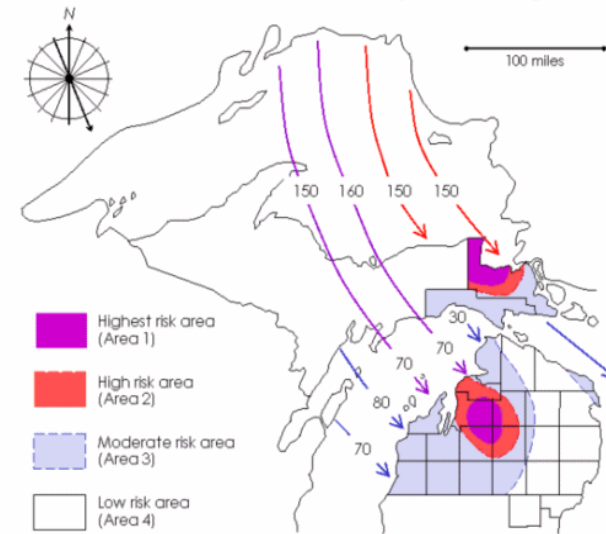

North Flow (350-360-010)

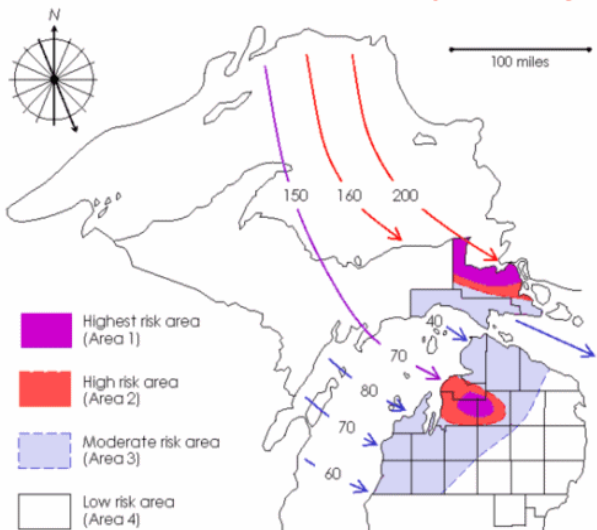

North-Northwest Flow (330-340)

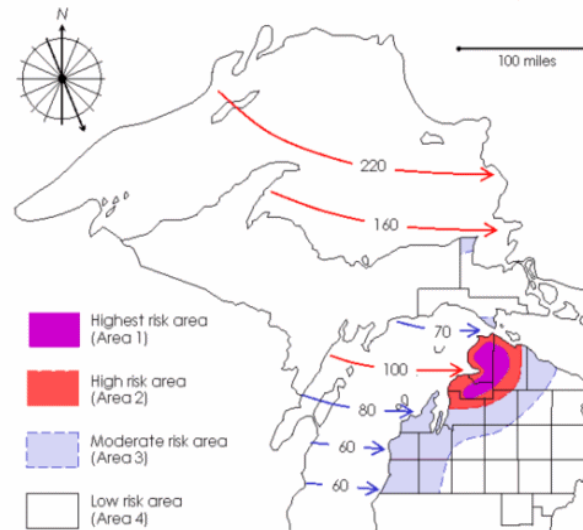

Northwest Flow (310-320)

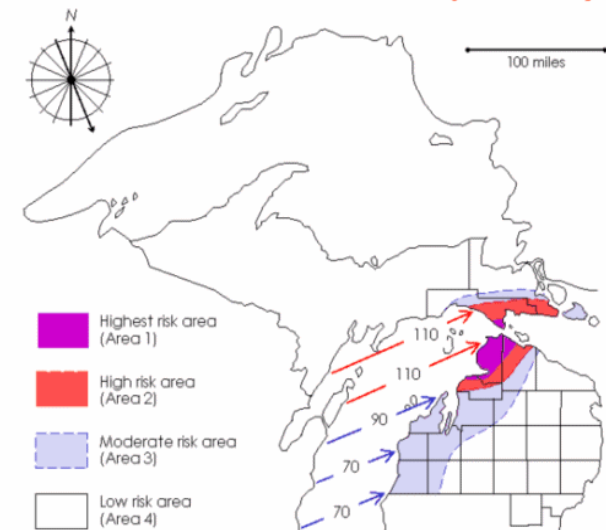

West-Northwest Flow (290-300)

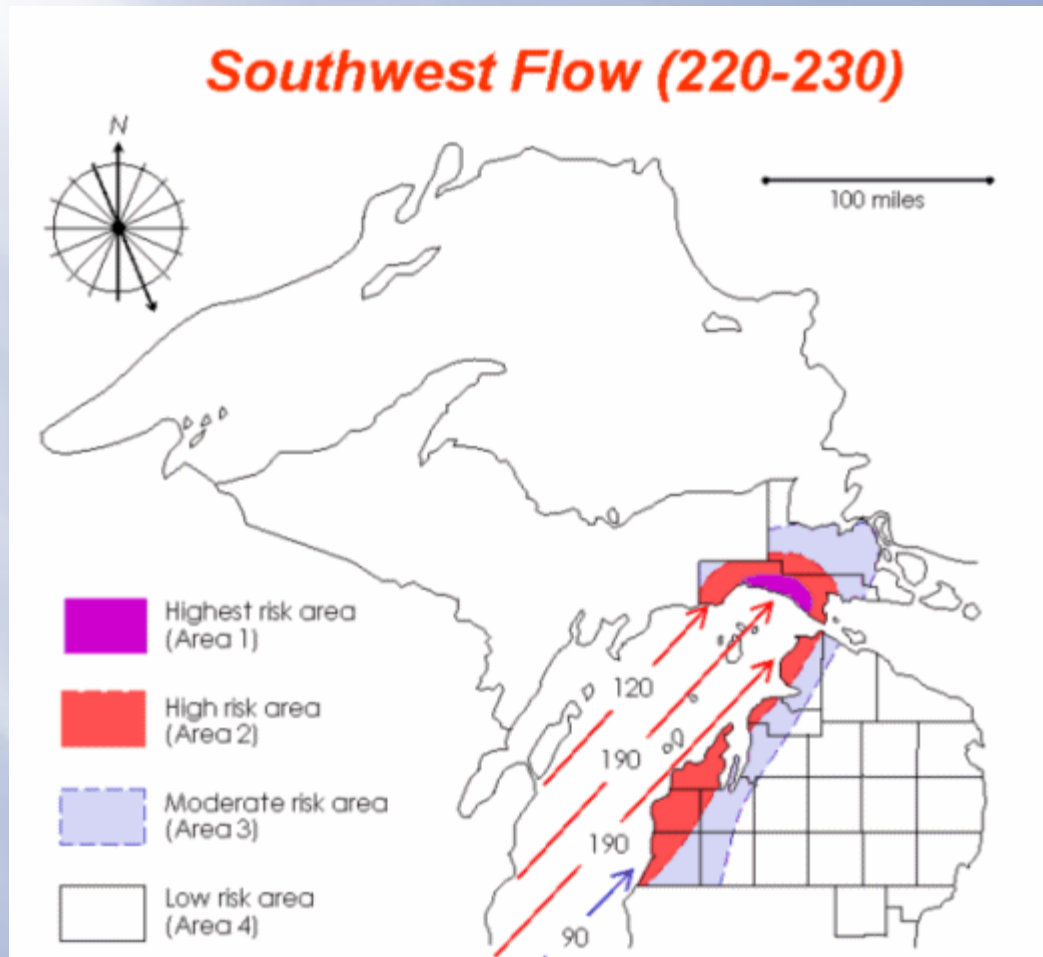

West Flow (260-270-280)

West-Southwest Flow (240-250)

Other Impacts on LES - Wind

Other Impacts on LES – Air Temperature

- For Lake Effect Snowfall
 - Temperature (lake) – Temperature (5000 feet) ~ 13C or more
- Year to year lake surface temperatures vary by no more than about 7C.
- Temperatures at 5000 feet vary by as much as 40C (from -20° C to +20° C)
 - Due to changing weather patterns

Conclusions:

- ▣ Overall, wind and air temperatures (i.e. weather patterns) have a much larger impact on lake effect than lake water temperatures
 - Note the early 2010-2011 snow season in Gaylord
- ▣ Warmer lakes could produce a stronger early season event
 - Could be rain at the coast
 - Lake temperatures will drop rapidly

Overall Conclusion: More myth than truth!
